

I CLAIM:

1. A floor lamp with a retractable shade essentially comprised of a base erected with a post screwed upwards in sequence a holder, a support and an adjusting threaded rod; and a shade to the outer
5 circumference of the post is characterized by:
a press disk allowing vertical movement being pivoted to the bottom of the post, a compression coil being provided around the post, the top and the bottom of the compression coil respectively holding against the holder and the press disk;
10 the adjusting threaded rod being erected and locked to the top of the support, and a flange being protruded from the outer circumference of the adjusting threaded rod at where close to the upper section of the adjusting threaded rod;
the shade being comprised of multiple rings into a tube adhered on
15 its exterior a piece of non-extendable paper; a loop being disposed at the lateral support of the upper ring to allow the insertion of the adjusting threaded rod before being locked with a nut; an arc being curved at the center of a lever provided to the lower ring to bypass the post to pull down the press disk and the compression coil to
20 stretch up the shade;

and

two trenches of elevation being provided in mirror position at the bottom of the press disk, and a groove being defined between both elevations to hold the lever at the lower ring of the shade.

5 2.

A floor lamp with a retractable shade as claimed in Claim 1, wherein, the top of the post inserted with the press disk and the compression coil is further provided with a connection rod to receive insertion of multiple holders and bulbs in series; and the top of the connection rod is locked with the adjusting threaded rod adapted with the nut to receive the mounting of the shade in larger size of the present invention.
